

## How is border-box different from content-box in CSS?

1070 Administrator Fri, Jun 3, 2022 [CSS](#) 0 3357

content-box is the default value box-sizing property. The height and the width properties consist only of the content by excluding the border and padding. Consider an example as shown:

Here, the box-sizing for the div element is given as the content-box. That means, the height and width considered for the div content exclude the padding and border. We will get full height and width parameters specified for the content as shown in the image below.

### Box Model is content-box

The border-box property includes the content, padding, and border in the height and width properties. Consider an example as shown:

Here, the box-sizing for the div element is given as border-box. That means the height and width considered for the div content will also include the padding and border. This means that the actual height of the div content will be:

and the actual width of the div content would be:

This is represented in the image below.
