

Are you interested designing or developing your own iPhone Application? Teehan+Lax has created an **iPhone GUI PSD** to help designers pitch and develop polished concepts using Photoshop. The elements are built with vectors for easy editing and scaling. Along with Apple's official release of the new iPhone 3.0 software came a number of new graphic GUI elements. We have been holding off updating the iPhone GUI Photoshop file until we could properly implement the additions. We built it using vectors, so it's all still fully editable. Apple's SDK is amazing, but when we need to mock up something quickly for a pitch we turn to this.

Some of the changes and additions in the 3.0 **iPhone GUI PSD** include:

- Map and map elements including curl
- Copy and paste elements
- Timeline bar editor
- Horizontal iPhone
- Horizontal Panels bars and keyboards
