imgAreaSelect is a **jQuery plugin** that enables you to **create selectable areas on images** which is a widely used technique for cropping images. Once an area is selected, you can get the x-y coordinates & apply any actions on that part of the image like **cropping** or implementing effects.

The plugin is very flexible & offers options like:

- Aspect Ratio
- Max Height
- Max Width
- Opacity
- Whether it can be resized or not
- Keyboard support & more.

There is also an image crop tutorial using **imgAreaSelect** & PHP that can be found here.

Requirements: jQuery Library

Compatibility: All Major Browsers
