**OpenCart** is an **open source shopping cart** that is built with **PHP** & stores the data in **MySQL**. The application has every standard feature an **e-commerce** website may need like:

- Unlimited categories
- Multiple images for products
- Customer reviews
- Multiple currencies & more.

OpenCart's front & backends can be expanded with modules (there are already more than 30 modules). It has also support for:

- Templating
- Multiple payment gateways
- Multiple languages
- Various shipping methods (like weight based shipping) & more.

The open source shopping cart system can be managed with an easy-to-use administrator

panel where all the orders can be viewed, products can be defined, etc.

A very nice feature OpenCart offers is the "coupons" where discounts can be set on a "per product" basis. There is also another **open source e-commerce project** named OpenCart Zero which is derived form **OpenCart**.

Requirements: PHP, MySQL
