

TinyBox - JavaScript Lightweight Modal Window Popup Script

199 Administrator Fri, Jan 8, 2010 [Web Development](#) 0 7486

TinyBox is a lightweight and standalone **modal window script**. At only 3.4KB it doesn't include any slideshow capabilities built-in but it can **display any AJAX or HTML content** (from text to videos). Future versions will include additional features. It can also be used for images and auto hiding alerts. The popups fade in/out and dynamically size based on the content if enabled. The styling is completely customizable through the simple CSS. TinyBox does not depend on any JavaScript frameworks.

With the auto-hide support, the script can be used to show notifications. To **display a popup box** use the following code:

```
TINY.box.show('advanced.html',1,300,150,1,3);
```

There is nothing to initialize, just start using the script. The TINY.box.show function takes 6 parameters:

1. The HTML content for the box or the relative path to the AJAX source
2. A toggle (true/false or 1/0) if the content is via AJAX
3. The width of the window (use 0 for auto)
4. The height of the window (use 0 for auto)
5. A toggle (true/false or 1/0) to animate the window
6. The time in seconds to wait before auto hiding the popup (optional).

This **JavaScript Modal Window Script** has been tested in all major browsers and is available free of charge for both personal or commercial projects under the creative commons license.
