Use PHP Functions In JavaScript with PHP.JS Library

PHP.JS is a **JavaScript** library that enables anyone to use **PHP functions** on client-side. It can be very helpful to any developer who wants to get the **PHP functions** on static pages with JavaScript to get the extra functionality (like being able to use file_get_contents(), mktime(), serialize()) & take the load off the server. Currently about 400 **PHP functions are ported to JavaScript** & there are still ones being experimented or waiting to be included. But it is possible to find the most popular ones (even md5()). The download packages can be totally customized & it is possible to get only the functions you need besides all of them.

No server component required to use **PHP functions in JavaScript**. To use **php.js** you can either:

- Goto one of the Functions and just Copy-Paste it :)
- Customize & download a package (only select what you need)
- Download the default package (big size use for study only)

If you know how to use **functions in PHP**, you should know how to do it in **JavaScript** with php.js

Requirements: No Requirements

Compatibility: All Major Browsers
