

JavaScript Tree Menu Component - jsTree Menu

203 Administrator Sat, Jan 9, 2010 [Web Development](#) 0 6242

jsTree is a cross-browser, **free & flexible JavaScript tree menu** component with various features. It can create the tree from predefined HTML, JSON or XML data. Different types of nodes (open, close, rename, create, delete) can be created & supports various callbacks (onchange, oncreate, ondelete, onload, etc.).

A great feature is async loading for creating dynamic trees by simply mentioning an URL for requesting data when needed.

Other features of jsTree:

- Drag & drop of nodes
- Multiple node selection
- Multilingual - same tree in as many languages as you like
- Ability to customize the look & feel
- Animated open/close of nodes
- Optional keyboard navigation
- Ability to move nodes between multiple trees

The **javascript tree menu** component can also work as a jQuery plugin.

Requirements: No Requirements

Compatibility: All Major Browsers
