# Create Dynamic Tabs with jQuery

292 Administrator Sat, Feb 6, 2010 Web Development 0 4051

Janko has written a throughout tutorial that shows you How to Use jQuery to Create Dynamic Tabs that can be added and removed dynamically. He has also mentioned how to use tabs and in which context should they be used in order to make them meaningful and usable.

When we talk about tabs on web we usually think about tabs used for navigation. However, in this case we want to use them for showing different entities on the same page. We will try to simulate tabs as seen in browsers. Take Google docs for example, instead of opening each document in a new window (or browser tab), you could open them in page tabs.
