

Stylish Cross-Browser CSS Buttons - Simply-Buttons v2

43 Administrator Thu, Nov 12, 2009 [Web Development](#) 0 4069

Simply-Buttons is a technique to create good-looking & cross-browser CSS buttons. The buttons are created with pure CSS and, optionally, improved with JavaScript (code is provided). They fit to any text & come with 3 states: inactive, active and hover. Their compatibility is tested on IE6, IE7, FF(PC/MAC), Safari, SafariMobile, Opera(PC/MAC). For some reason, clicking on a button seems to freeze the google chrome browser.

These CSS buttons are inspired from:

1. [How to make sexy buttons with CSS](#)
2. [Rediscovering the Button Element](#)

Benefits

- Buttons size automatically to fit text.

- There are 3 states: Inactive, Active, and Hover.
- They look and behave the same way in every browser and operating system.
- They do not need the javascript to work, they work with just the CSS.
- Way better looking buttons than what anyone else can do with XHTML/CSS, isn't that reason enough?!
