

# ValidForm Builder - Creating Forms With Validation

456 Administrator Wed, Apr 21, 2010 [Web Development](#) 0 3972

ValidForm Builder is an impressive open source **form creation library** that relies on PHP and JavaScript (jQuery). The library outputs standards-based **web forms** (XHTML 1.0 valid) that are validated both on the client-side and the server-side. It supports every input type (textbox, checkbox, radio, etc.) and comes with ready-to-use **validation rules** (integer, required, e-mail, etc.)

ValidForm Builder also has a **captcha class** which is very easy to integrate and can display a new captcha on every click.
