# Create Interactive JavaScript Charts With Highcharts

95  Administrator  Fri, Dec 4, 2009   0  4141

Highcharts is a **JavaScript charting library** for creating interactive charts in various types (line, spline, area, areaspline, column, bar, pie & scatter). The library offers a high-level of usability with features like:

- Tooltip labels displaying info on hovered items
- Zooming on a specific part of the chart
- Text rotation on labels for a better readability

Highcharts has an admirable effort in browser compatibility. For standard browsers it uses the canvas element and in some cases SVG for the graphics rendering. In Internet Explorer, graphics are drawn using VML. Besides all major browsers, it works in iPhone & IE6.

The library is offered for free to be used in personal/non-commercial projects & requires a license for commercial ones
