Pythagorean Identities

992 Administrator Wed, Apr 17, 2019 Education 0 3866

a. $\sin^2\theta + \cos^2\theta = 1$ b. $1 + \tan^2\theta = \sec^2\theta$ c. $1 + \cot^2\theta = \csc^2\theta$

From (a) $\sin^2\theta = 1 - \cos^2\theta$ i.e. $\cos^2\theta = 1 - \sin^2\theta$

These are called Pythagorean identities, because, as we will see in their proof, they are the trigonometric version of the Pythagorean theorem. The two identities are simply different versions of (a).

The first shows how we can express $\sin \theta$ in terms of $\cos \theta$; the second shows how we can express $\cos \theta$ in terms of $\sin \theta$.

Note: $\sin^2\theta$ "sine squared theta" means $(\sin \theta)^2$.
